

Aeration & Over Seeding

Break up the compacted soil by aerating in the fall. This will allow water and nutrients to get deeper in the soil and help establish stronger, deeper root systems.

Over-seeding introduces new grass seed to fill in bare or thin areas as well as thickening existing turf.

Lawn Winterizer

The lawn winterizer application shall take place late in November. This application is a slow release granular fertilizer application to help promote strong, deep roots for a healthy lawn in the spring.

Contact us today to get your fall Aeration, Over-Seeding & Lawn Applications scheduled. Services begin in September.
